Technical Writing

Lecture (6)

By

Dr. Ahmed Salah Abou Taleb

Faculty of Engineering - Fayoum University

1st Semester

2025 - 2026

Nursing Process

2

Definition:

- ❑ Nursing process is a **critical thinking** process that **professional** nurse use to **apply** the best available evidence to **creating and promoting** human functions and **response** to health and illness (American Nurses Association, 2010).
- ❑ Nursing process is a **systematic** method of providing care to patients.
- ❑ Nursing process is a **systematic** method to planning and providing **individualized** nursing cares..

Purposes of Nursing Process

3

- ❑ To **identify** a patient's health status and actual or potential health care **problems** or needs.
- ❑ To **establish** plans to meet the identified needs.
- ❑ To **deliver** specific nursing interventions to meet those needs..

Components of Nursing Process

4

It involves

- Assessment,
- Nursing diagnosis,
- Planning,
- Implementation, and
- Evaluation..

Characteristics of Nursing Process

5

- ☐ Cyclic,
- ☐ Dynamic nature,
- ☐ Patient centeredness,
- ☐ Focus on problem solving and decision making,
- ☐ Interpersonal and collaborative style,
- ☐ Universal applicability, and
- ☐ Use of critical thinking and clinical reasoning..

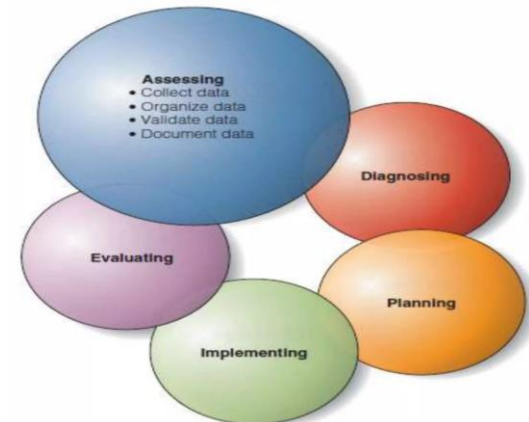

Components of Nursing Process

6

1. Assessment (Collecting Data)

Definition:

Assessment is the **systematic** and **continuous** collection,
organization,
validation, and
documentation
of data (information)..

Components of Nursing Process

7

1. Assessment (Collecting Data)

Types of assessment:

1. Initial nursing assessment,
2. Problem-focused assessment,
3. Emergency assessment, and
4. Time-lapsed reassessment..

Components of Nursing Process

8

1. Assessment (Collecting Data)

Types of assessment:

1. **Initial nursing assessment:** To **performed** within specified time **after** admission. To **establish** a complete database for problem identification.
eg: Nursing admission assessment
2. **Problem-focused assessment :** To **determine** the status of **specific** problem identified in an earlier assessment.
eg: Hourly checking of vital signs of fever patient..

Components of Nursing Process

9

1. Assessment (Collecting Data)

Types of assessment:

3. **Emergency assessment:** **During** emergency to **identify** any life-threatening situation.
eg: Rapid assessment of an individual's airway, breathing status, and circulation during a cardiac arrest.
4. **Time-lapsed reassessment:** several months **after** initial assessment. To **compare** the patient's current health status with the data previously obtained..

Components of Nursing Process

10

1. Assessment (Collecting Data)

Collection of Data

- ❑ Data collection is the process of **gathering** information about a patient's health status.
- ❑ It **includes** the health history, physical examination, results of laboratory and diagnostic tests, and material contributed by other health personal..

Components of Nursing Process

11

1. Assessment (Collecting Data)

Types of Data

```
graph TD; A[Types of Data] --> B[Subjective data]; A --> C[Objective data]
```

Subjective data

Also referred to as symptoms or covert data.

Are clear **only** to the person affected and can be described only by that person.

eg: Itching, pain, feeling of worry.

Objective data

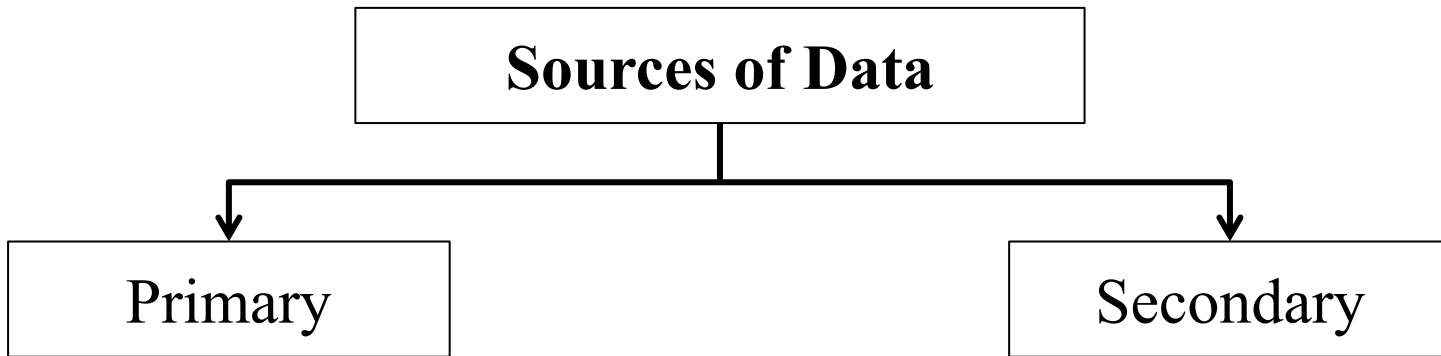

Also referred to as signs or overt data,

Are detectable by an **observer** or can be measured or tested against an **accepted standard**. They can be seen, heard, felt, or smelled, and they are obtained by observation or physical examination
eg: Blood pressure reading..

Components of Nursing Process

12

1. Assessment (Collecting Data)

It is the **direct** source of information.

The **patient** is the primary source of data.

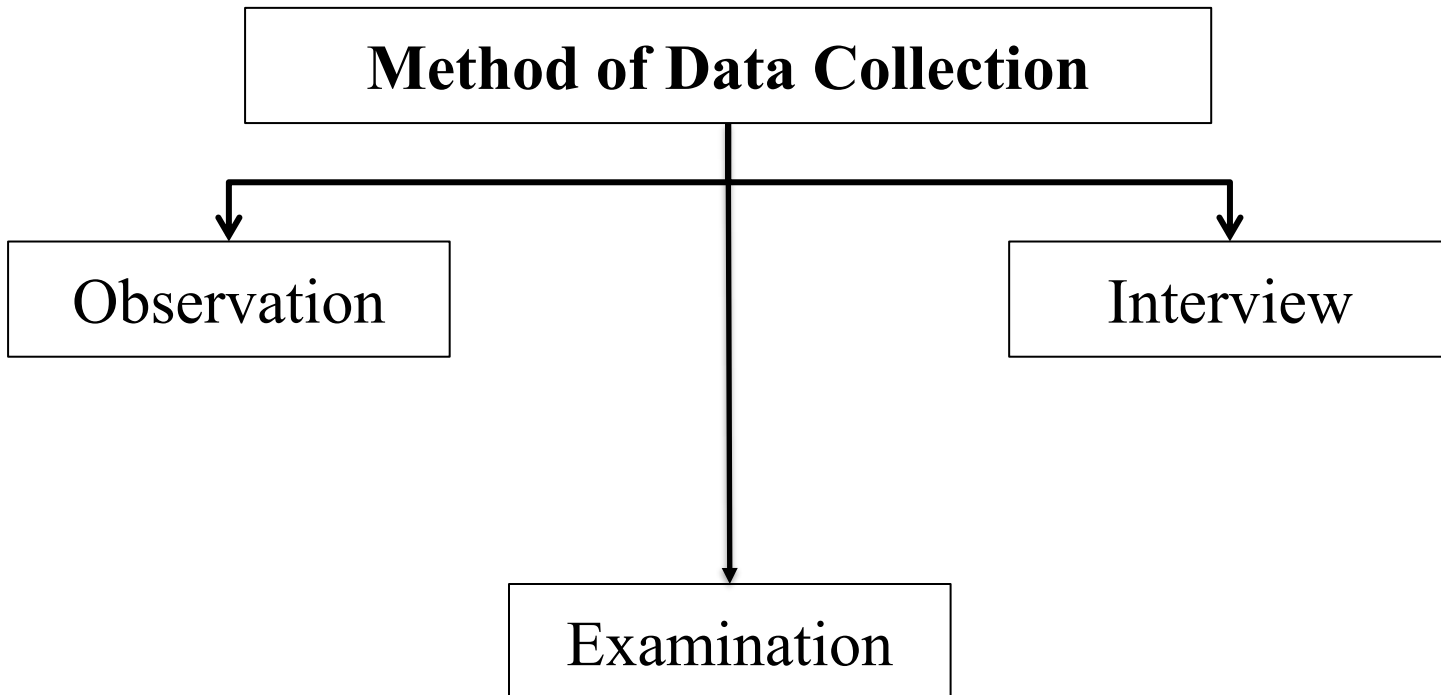

It is the **indirect** source of information.

All sources **other than** patient are considered secondary.
eg: Family members, health professionals, records and reports, laboratory and diagnostics results.

Components of Nursing Process

13

1. Assessment (Collecting Data)

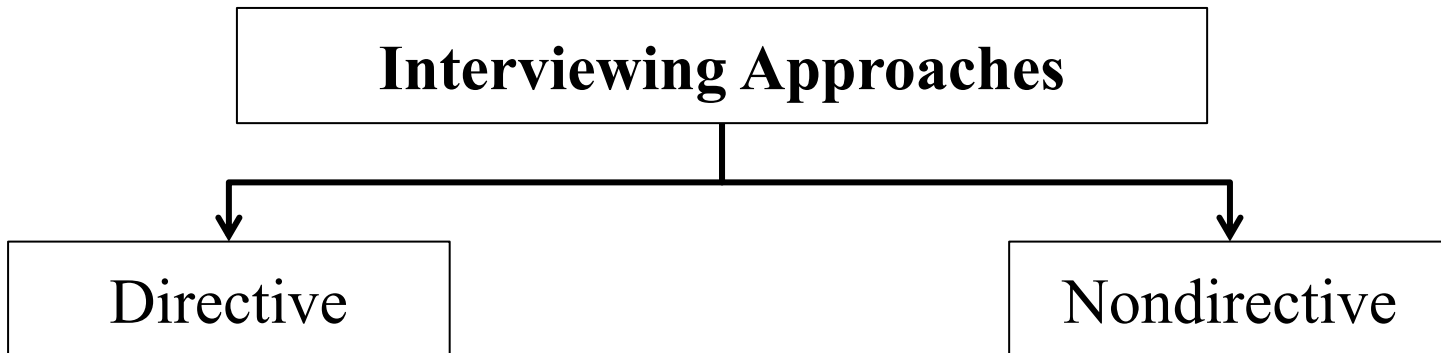

Components of Nursing Process

14

1. Assessment (Collecting Data)

Method of Data Collection:

1. **Observation:** It is **gathering** data by using the **senses**.
Vision, Smell and Hearing are used.
2. **Interview:** Is a **planned** communication or conversation with a purpose.

Is highly structured and **directly** ask the questions. The nurse **controls** the interview.

Report building interview
The nurse **allow** the patient to controls the interview.

Components of Nursing Process

15

1. Assessment (Collecting Data)

Method of Data Collection:

3. **Examination:** The physical examination is a **systematic** data collection method to **detect** health problems.

To conduct the examination, the nurse uses **techniques** of inspection, palpation, percussion and auscultation..

Components of Nursing Process

16

1. Assessment (Organizing Data)

Organization of data:

- ☐ The nurse uses a **format** that organizes the assessment data systematically.
- ☐ This is often **referred** to as nursing health history or nursing assessment form..

Assessment (Validating Data)

Validation of data:

- ☐ The information gathered during the assessment is “**double-checked**” or **verified** to confirm that it is accurate and complete..

Components of Nursing Process

17

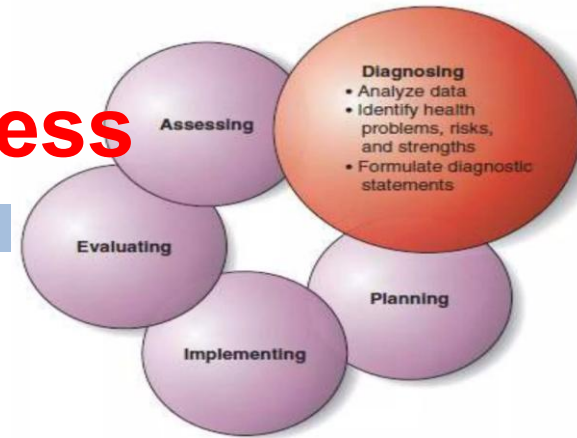

1. Assessment (Documenting Data)

Documentation of data:

- ☐ To complete the assessment phase, the nurse **records** patient data.
- ☐ Accurate documentation is **essential** and should **include** all data collected about the patient's health status..

Components of Nursing Process

18

2. Diagnosing

Diagnosis: Is the **second** phase of the nursing process.

❑ In this phase, nurses use **critical thinking** skills to **interpret** assessment data to identify patient problems.

Definition:

A clinical **judgment** concerning a human response to health conditions/life processes, or a vulnerability for that response, by an individual, family, group, or community.

NANDA (North American Nursing Diagnosis Association)..

Components of Nursing Process

19

2. Diagnosing

Status of the Nursing Diagnosis:

The status of nursing diagnosis (3 items) are:

1. An **actual diagnosis**: is a patient problem that is **present** at the **time** of the nursing assessment.
2. A **health promotion diagnosis**: relates to patients' **preparation** to **improve** their health condition.
3. A **risk nursing diagnosis**: Is a clinical **judgement** that a problem does **not** exist, but the **presence** of risk factors **indicates** that a problem may **develop** if adequate care is **not** given..

Components of Nursing Process

20

2. Diagnosing

Nursing Diagnosis

```
graph TD; A[Nursing Diagnosis] --> B[Problem and its definition (P)]; A --> C[Etiology (E)]; A --> D[Signs and symptoms (S)];
```

Problem and its
definition (P)

describes the
patient's health
problem.

Etiology (E)

identifies
causes of the
health problem.

Signs and
symptoms (S)

Characteristics
manifested by
the patient..

Components of Nursing Process

21

2. Diagnosing

Problem (P)	Etiology (E)	Sign and symptoms (S)

Example:

Acute pain related to abdominal surgery as evidenced by patient discomfort and pain scale.

Problem (P)	Etiology (E)	Sign and symptoms (S)
Pain	Surgery of abdomen	Pain scale and discomfort of patient..

Components of Nursing Process

22

2. Diagnosing

Nursing diagnosis	Medical diagnosis
Is a statement of nursing judgment that made by nurse, by their education, experience, and expertise, are licensed to treat.	Is made by physician.
It describe the human response to an illness or a health problem	It refer to disease processes.
It may change as the patients' responses change.	It remain the same for as long as the disease is present ..

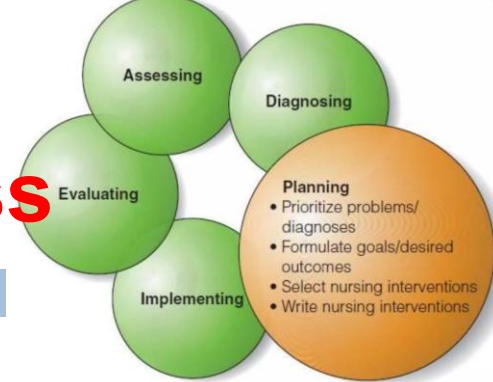

Components of Nursing Process

23

2. Diagnosing

Nursing diagnosis	Medical diagnosis
Ineffective breathing pattern	Asthma
Activity intolerance	Cerebrovascular accident
Acute pain	Appendicitis
Disturbed body image	Amputation..

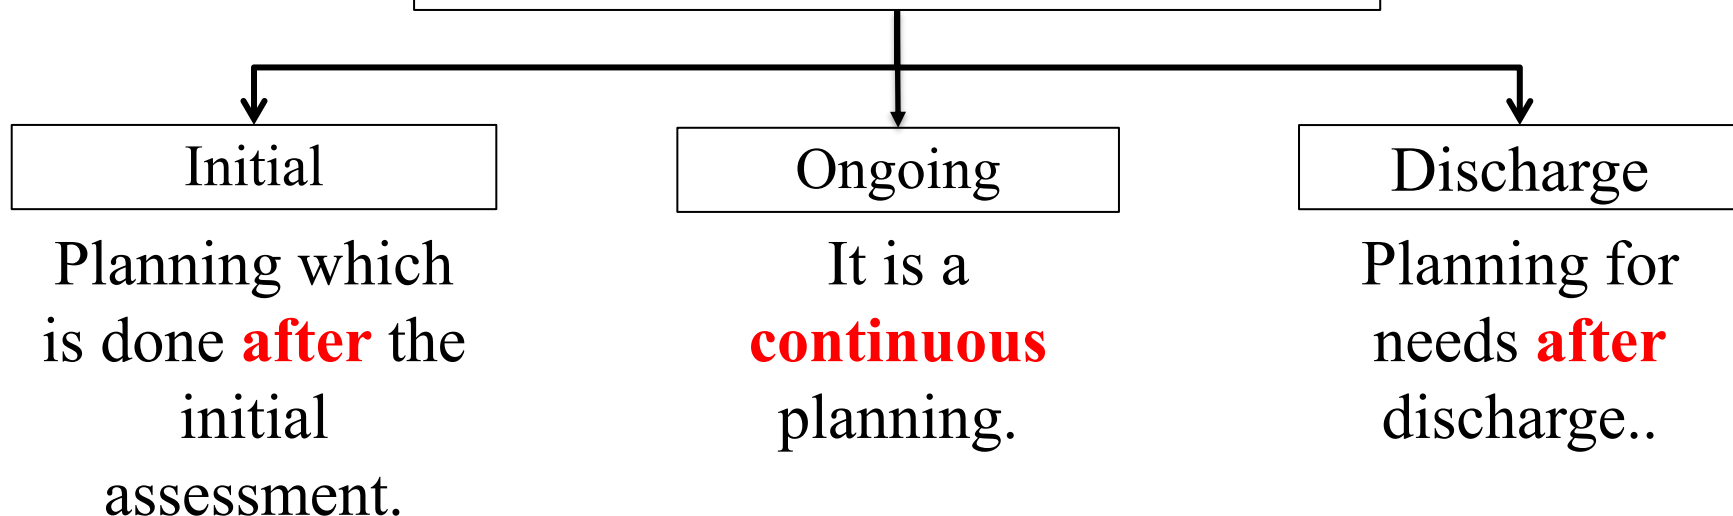

Components of Nursing Process

3. Planning

- ❑ Planning **involves** decision making and problem solving.
- ❑ It is the process of **formulating** patient goals and **designing** the nursing interventions **required** to prevent, reduce, or eliminate the patient's health problems..

Types of Planning

Components of Nursing Process

25

3. Planning

Planning process includes:

- ❑ **Setting** priorities.
- ❑ **Establishing** patient goals/desired outcomes
- ❑ **Selecting** nursing interventions and activities
- ❑ **Writing** individualized nursing interventions on care plans..

Setting priorities:

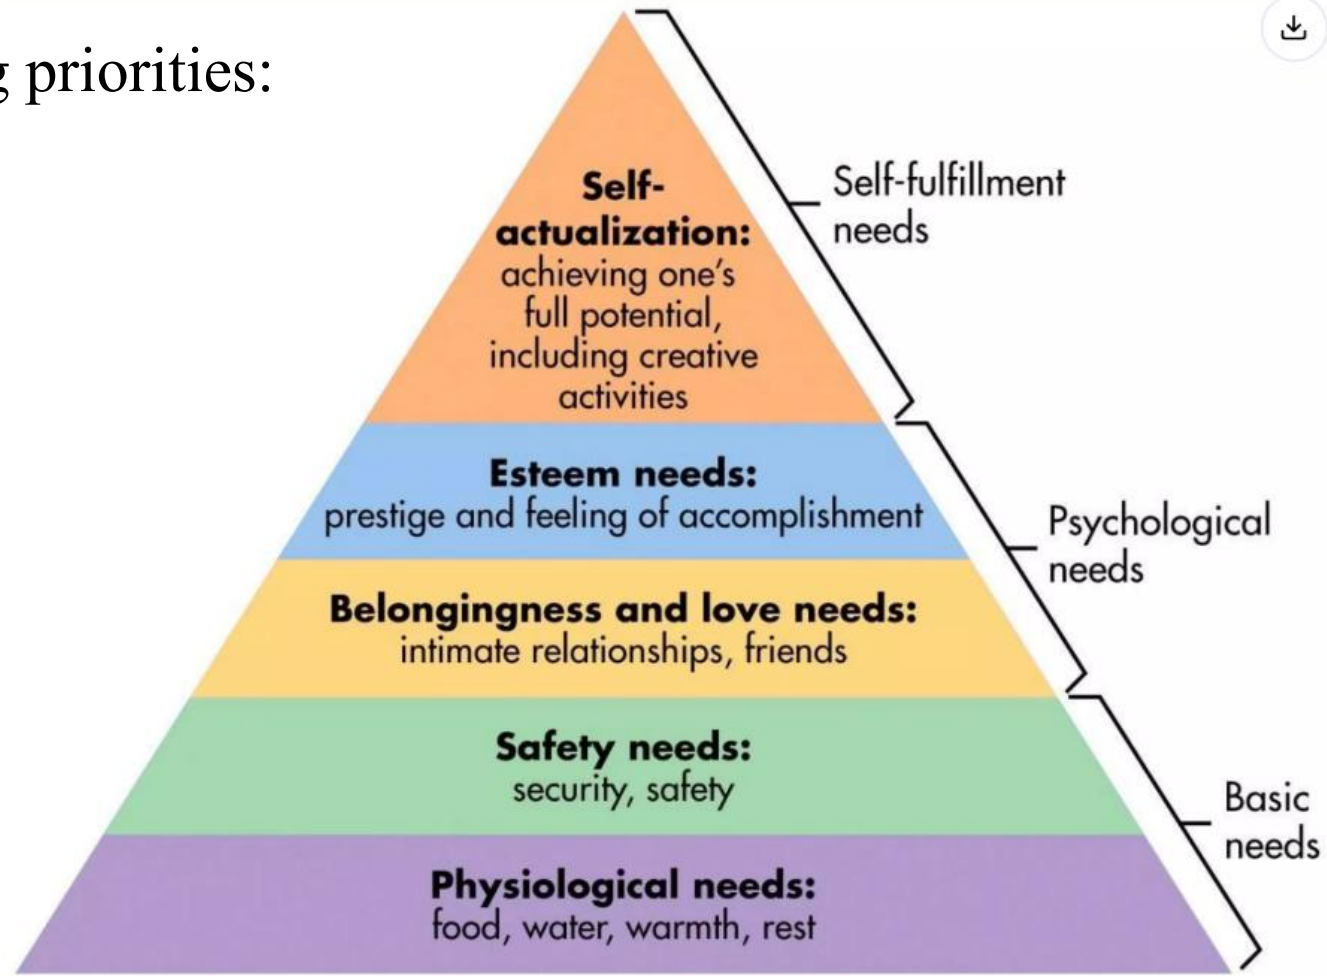

- ❑ The nurse **begin** planning by **deciding** which nursing diagnosis requires attention first, which second, and so on.
- ❑ Nurses frequently use **Maslow's hierarchy** of needs when setting priorities.

Components of Nursing Process

26

3. Planning

Setting priorities:

Components of Nursing Process

27

3. Planning

Establishing patient goals/desired outcomes:

- ❑ **After** establishing priorities, the nurse **set** goals for each nursing diagnosis.

- ❑ Goals **may be** short term or long term..

Selecting nursing interventions and activities:

- ❑ A nursing intervention is any **treatment**, that a nurse performs to **improve** patient's health..

Components of Nursing Process

28

3. Planning

Types of Nursing Interventions:

1. **Independent interventions:** are those activities that nurses are **licensed** to initiate on the basis of their knowledge and skills.
2. **Dependent interventions:** are activities carried out **under** the orders or supervision licensed physician.
3. **Collaborative interventions:** are action the nurse **carries out** in collaboration with other health team members..

Components of Nursing Process

29

3. Planning

Writing Individualized Nursing Interventions:

- ❑ After **choosing** the appropriate nursing interventions, the nurse **writes** them on the care plan.
- ❑ Nursing **care plan** is a written or computerized information about the patient's care..

Components of Nursing Process

30

4. Implementation

Implementation **consists of** doing and documenting the activities.

The process of implementation includes:

- ❑ **Implementing** the nursing interventions.
- ❑ **Documenting** nursing activities..

Components of Nursing Process

31

5. Evaluation

Evaluation is a planned, ongoing, purposeful activity in which the nurse **determines:**

- (a) The Patient's **progress** toward achievement of goals/outcomes and
- (b) The **effectiveness** of the nursing care plan..

The evaluation includes:

- ❑ **Comparing** the data with desired outcomes
- ❑ **Continuing, modifying, or terminating** the nursing care plan..

Nursing Process

32
