

Nursing Process Assignment

❖ **Read the following case study carefully**

Required Tasks:

1. Identify **Subjective** and **Objective** data from the paragraph above.
2. Write **Three Nursing Problems and Formulate Nursing Diagnoses** with priority using the PES format (Problem, Etiology, Signs/Symptoms).
3. Develop a **Nursing Care Plan** including: One SMART Goal, Three Nursing Interventions, and Evaluation criteria.

Case 1: Respiratory

Mr. Ahmed, 65-year-old male. Heavy smoker with a diagnosis of COPD exacerbation and suspected pneumonia. Mr. Ahmed is admitted to the medical ward in significant distress. He is sitting in a tripod position, leaning forward to catch his breath, and you observe him using accessory muscles (neck and shoulder muscles) to breathe. His skin and nail beds show signs of cyanosis (bluish tint). His vital signs are critical: O₂ Saturation is 85%, his Respiratory Rate is 32 bpm, and he has a high fever of 39°C accompanied by shivering. During the assessment, he gasps, "I feel like I'm suffocating, and I'm terrified I'll stop breathing." He is coughing up thick, green sputum but appears physically too weak to expectorate (spit it out). Regarding his daily living, he mentions, "I haven't eaten for 24 hours because I am too tired to chew." He also admits a lack of self-care skills, stating, "I don't know how to use this new inhaler they gave me."

Case 2: Fluid & electrolytes

Sami, a 20-year-old university student. He was admitted with a 48-hour history of severe vomiting and diarrhea (Gastroenteritis). Sami presents to the emergency department in a state of moderate to severe dehydration. During the physical assessment, you observe sunken eyes, dry mucous membranes (mouth), and poor skin turgor (skin tents when pinched). His hemodynamic status is unstable, with a Blood Pressure of 90/60 mmHg and a Pulse of 124 bpm (tachycardia). Sami is in visible distress, rating his abdominal pain at 8/10. He tells you, "My stomach hurts so much, and I feel like the room is spinning when I move." This dizziness was confirmed when he attempted to walk to the bathroom; he stumbled and nearly fell, requiring immediate assistance. Upon further inspection, the perianal skin is red, raw, and painful to the touch due to the frequency of the diarrhea. Psychologically, Sami is highly stressed, expressing, "I'm worried I will miss my final exams."

Case 3: Cardiovascular

Mrs. Mona (55y) has Acute Heart Failure. She states, "I can't lie down in bed because I feel like I'm drowning; I have to sleep in a chair." You see +3 pitting edema in her legs and hear crackles in her lungs. Respiration: 30 bpm. She is very weak and says, "I live alone and have no one to help me at home; I can't even wash my face without gasping for air. Her skin is cool and clammy. She is crying because she lives alone and has no one to help her at home."

Case 4: Diabetes

A 40-year-old male has a Blood Glucose of 520 mg/dL. He is confused and disoriented to time and place. He has Kussmaul breathing and a fruity breath odor. You notice a large, infected ulcer on his left foot that he didn't even feel because of numbness. He says, "I stopped taking my insulin three days ago because I couldn't afford it." He is very dehydrated and Vital signs: Pulse: 125 bpm, BP: 95/65 mmHg.
